-!- FUNCTION: May catalyze the degradation of intercellular cohesive structures in the cornified layer of the skin in the continuous structures in the cornified layer of the skin in the continuous shedding of cells from the skin surface. Specific for amino acid residues with aromatic side chains in the PI position. SCCE
                                                                                                                                                                                                                                                  01-0CT-1996 (Rel. 34, Created)

cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-
|-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation
of precursors to inflammatory cytokines.
TISSUE SPECIFICITY: Abundantly expressed in the skin and is
expressed by keratinocytes in the epidermis. Very low levels are
also seen in the brain and kidney.
SIMILARITY: Belongs to peptidase family S1. Kallikrein subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            XALIKREIN 7.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunology 78:159-165(1993)

-!- FUNCTION: Contributes to the lung's defense against inhaled microorganisms. Binds strongly maltose residues and to a lesser exten other alpha-glucosyl moieties. It could participate in the extracellular reorganization or turnover of pulmonary surfactant.
-!- SUBSUNIT: Oligomeric complex of 4 set of homotrimers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-FEB-1994 (Rel. 28, Created)

-!- MISCELLANEOUS: Pulmonary surfactant consists of 90% lipid and 10% protein. There are 4 surfactant-associated protein: 2 collagenous, carbohydrate-binding glycoproteins (SP-A and SP-D) and 2 small hydrophobic proteins (SP-B and SP-C).
-!- SIMILARITY: Contains 1 collagenous domain.
-!- SIMILARITY: Contains 1 C-type lectin family domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HSSP; P35247; 1B08.

-!-SUBUNT: Oligomeric complex of set of homotrimers.
-!-SUBUNT: Oligomeric complex of set of homotrimers.
-!-SUBCLIULAR LOCATION: THIS PROTEIN IS LOCATED INTRACELLULAR, MOST PREDOMINANTLY IN THE WOUGH ENDOPLASMIC RETICCLUM AND IN THE GOLGI APPARATUS, AND LITTLE OR NO MBP IS PRESENT IN PLASMA MEMBRANES AND LISSOSNEES. THE MBP IS EXCLUSIVELY LOCALIZED IN THE CISTERNAL SPACE OF THE ORGANELLES, PROBABLY AS A LOCASLEY BOUND MEMBRANE PROTEIN.
-!-SIMILARITY: Contains I Collagenous domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -!- FUNCTION: Binds mannose and N-acetylglucosamine in a calcium-dependent manner. Is capable of host defense against pathogens, by activating the classical complement pathway independently of the

alpha antigens. "Frewin M.R., Cobbold S.P., Waldmann H.;

alpha antigens. "184-188 (1994).

Tissue Antigens 43:184-188 (1994).

-!- FUNDTION! Identifies cytotoxic/suppressor T-cells that interact with MHC class I bearing targets. CDB is thought to play a role in the process of T-cell mediated Killing. CDB alpha chains binds to class I MHC molecules alpha -3 domains.

-!- SUBUNIT: In general heterodimer of an alpha and a beta chain linked by two disulfide bonds. Can also form homodimers.

-!- SUBCELLULAR LOCATION: Type I membrane protein.

-!- SIMILARITY: Contains 1 immunoglobulin-like V-type domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    T-CELL SURFACE GLYCOPROTEIN CD8 ALPHA

-!- FUNCTION: Major secreted protease of mast cells with suspected
roles in vasoactive poptide generation, extracellular matrix
degradation, and regulation of gland secretion.
-!- CATALYTIC ACTIVITY: Preferential cleavage: Phe-|-xaa > Tyr-|-Xaa >
-!- SUBCELLULAR LOCATION: Mast cell granules.
-!- SUBCELLULAR: Desprise and placenta.
-!- SUBCELLULAR: Belongs to peptidase family $1. Granzyme subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDIINE=93265916; PubMed=8495723; Sukenaga Y., Kido H., Neki A., Enomoto M., Ishida K., Takagi K., Katunuma N.; "Purification and molecular cloning of chymase from human tonsils."; PERS Lett. 323:119-122(1993).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 X-RAY CRYSTALLOGRAPHY (2.2 ANGSTROMS).

### ALIGNMENTS

RESULT 1

```
The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metaetsals, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide
                                                                                                                                    Stratum corneum chymotrypsin enzyme; SCCE; cytostatic; vaccine; tumour; cancer; ovarian; breast; lung; colon; prostate; carcinoma; human; antisense therapy; malignant hyperplasia.
                                                                                                          Human stratum corneum chymotrypsin enzyme peptide #3 (residues 58-66).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Diagnosing cancer comprises detecting stratum corneum chymotrypsin

The present invention describes NoVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising; in one or more described above and a carrier; (2) a kit comprising; in one or more or more containers, the composition described above; (3) an isolated mucleic acid molecule described above; (3) a cell a vector comprising the uncleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically comprising the above vector; (6) an antibody that immunospecifically breamed to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above collaboration of a disease associated with altered levels of expression of the above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for a serior above; (10) a method for identifying a potential therapeutic agent for a perhology associated with the polypeptide; (11) a method of cor or preventing a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide described above polypeptide. Novy correctivity of the polypeptide described above polypeptide in a method for protective, antibacterial, virunide, immunomodulator, cytostatic, nocropic, neuroprotective antiparkinsonian and antilipaemic are are and and antilipaemic activity of the polypeptide above polypeptide of useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the mucleic acid sorders and various disorders such as diabetes or obesity, infections, cachexia, cachexia, cachexia, inmune disorders, haematopoicite disorders and various disorders when the polypeptide as human Novy from the pre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0; Gaps

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed conservation antibodies of exchaint and expressed sequence tags for identifying expressed conservation antibodies against it, detecting or quantitating a cutivity of (II) or to treat disease states involving (II). (II) is useful in sering an encipt markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abstrant protein expression or biological activity. The protein expression or biological activity. The convolvence applications in involving abstrant protein expression or biological activity. The protein expression of materials to fautations in the principle for genetic disorders or ther traits to assess biodiversity and to produce other types of deta and products dependent on DNA and and to produce other types of deta and products dependent on DNA and anino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the print way.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunomodulator; cytostatic; nootropic; neuroprotective;

the activity of the polypeptide described above; (12) a method for modulating the activity of the polypeptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide. Now; sequences have antidabetic, anotorotic, antibacterial, virucide, immunomodulator, cytostatic, nootropic, neuroprotective, antiparkinsonian and antilipaemic attivities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic acid molecule may be used to diagnose, treat or prevent metabolic acid molecule may be used to obsity, infections, candexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various probes, in chromosome mapping, tissue typing, preventive medicine and parmacogenomics. The present sequence represents a human NoVX from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            present invention.

New NOVX polypeptides and nucleic acids, useful for diagnosing,

```
The present invention relates to human tumour antigen-derived gene 15 (TADG-15) protein and coding sequence (see AAH23601 and AAB98500). TADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9.20 residues that lack TADG-15 protease activity are useful for vaccinating an individual against TADG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15
                                                                                                                                                                                              Novel extracellular serine protease, termed tumor antigen-derived gene 15 protein overexpressed in carcinomas and DNA encoding it, for diagnosis, treatment, prevention of cancer, particularly breast, ovarian cancer.
                                                                                                                                                                                                                                                                                       Example 10; Fig 1; 130pp; English.
                                                                                                            Tanimoto H;

WPI; 2003-381626/36. N-PSDB; ADA05741. New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

Claim 1; Page 172; 586pp; English.

The present invention describes NoVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carribed above; (3) an isolated nucleic acid described above; (3) an isolated nucleic acid containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the above vector; (6) an antibody that immunospecifically briefs to the polypeptide acid molecule described above; (5) a call comprising the above vector; (6) an antibody that immunospecifically breached or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of screening for a modulator of activity or of latency or predisposition or a pathology associated with the polypeptide; (12) a method of mammal; and (14) a method for producing the above polypeptide in a muchod for protectic, antibacterial, virucide, and antilipaemic activities, and can be used above polypeptide in a syndrome associated with a human disease. In polypeptide is useful in manufacturing a medicament for treating a pathology associated with a human disease. Contain and various of sorders such as diabetes or obesity, infections, cachexia, cancer, and molecule may be used to diasease. In process, in chromosome mapping, tissue typing, preventive medicine and process, in chromosome mapping, tissue typing, preventive medicine or processer; in the processer is neared to the processe

The present invention describes NoVX proteins, where X can be 1 to 55 cd e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit composition or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell of comprising the nucleic acid molecule described above; (5) a cell of presence or amount of the above polypeptide fescribed above; (7) methods for determining the paragraph of identifying an agent that binds to the above of adsease associated with altered levels of expression of the above a disease associated with altered levels of expression of the above and pathology that is related to an aberrant expression of a polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for aberrant physiological interactions of the polypeptide; (11) a method of secretarial physiology that is related to an aberrant expression or a pathology that is related to an aberrant expression or a pathology associated with the polypeptide; (12) a method for modulator of activity or of latency or predisposition to spending a pathology associated distributed described above; (13) a method of subjective described above polypeptide in a method for producing the above polypeptide in a method for producing the above polypeptide or the nucleic or proventing a pathology associated with the above polypeptide or the nucleic syndrome associated with a human disease. The polypeptide or the nucleic syndrome associated with a human disease. The polypeptide or the nucleic syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic disperser, hammed adabetes such as diabetes or obesity, infections, cardexia, cancer, d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenemics.

WPI; 2003-381626/36. N-PSDB; ADA05733 New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

Claim 1; Page 170; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 described above and a carrier; (1) a kit comprising, in one or more containers, the composition described above; (3) an isolated nuclear acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (3) a cell comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the breache or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the passance of a monut of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a

The enzyme encoded by this sequence is used in pharmaceutical, cosmetic

```
method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating or preventing a pathology associated with the above polypeptide in a method for modulating or preventing a pathology associated with the above polypeptide. Now; sequences have antidiabetic, anorectic, antibacterial, virucide, and antilipaemic activities, and can be used in gene therapy. The comparative of unautilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic actid modecute may be used to disapte or prevent metabolic disease, immune disorders such as Alzheimer's disease or Parkinson's disease, immune disorders such as Alzheimer's disease or Parkinson's probes, in otheromosome mapping, tissue typing, preventive and present sequence represents a human NovX from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleotide sequences encoding stratum corneum chymotryptic enzyme - and related vectors, transformed cells and polypeptides, useful for treating skin disorders, e.g. acne or psoriasis, and for identification of specific inhibitors:

Human amyloid precursor protein protease (AAW05181) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAT39781) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryotic (partic. B. coli) or eukaryotic (partic. AV-120 host cells. It is used to develop products for the design and testing of cpds. useful for treating or preventing conditions associated with beta-amyloid peptide, esp. Alzheimer's disease
and skin care products, especially to treat and prevent acne, xeroderma, or other hyperkeratotic conditions (e.g. callosities or keratosis pilaris), ichthyoses, psoriasis, eczema, etc. It is produced recombinantly following mammal, insect, plant, or microorganism transformation with plasmid pssor. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated human amyloid precursor protein protease - used to develop prods. for the treatment or diagnosis of associated conditions, esp.

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, or grandly linked to a promoter that drives expression of heterologous soce or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve to ramellorate a pathogenic condition, for development or resting of a cosmetic or a pharmaceutical formulation, and for the development of a cosmetic or a pharmaceutical formulation, and for the development of a cosmetic or a pharmaceutical formulation, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of inflammatory skin diseases selected from diseases consisting of epidermal hyperkeratosis. The mammal of the invention is also useful or the pidermal hyperkeratosis. The mammal of the invention is also useful compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the N-terminal synonymous with human stratum corneum corneum chymotryptic enzyme, SCCE synonymous with human kallikrein 7 (KLK7), used in the development of the envention of the invention of the i

potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the human stratum corneum chymotryptic enzyme, SCCE which is a serine protease synonymous with human kallikrein 7 (Kirx) and is used in the development of the transgenic mammals described in the invention
                                                                                                                                                                                                                                                                                                                                                           Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.

The present invention relates to the isolation of novel human proteases, and the nucleic acids encoding them. The sequences of the invention are useful for treating diseases and disorders such as cancers (e.g. breast, colon, lung), immune related diseases and disorders (e.g. inflammatory diseases and asthma), cardiovascular diseases (e.g. inflammatory diseases, merabolic coronary thrombosis), brain or neuronal-associated diseases, metabolic chisorders (e.g. diabetes, obesity), inflammatory disorders (e.g. diabetes, pain, sexual dysfunction, mood disorders at the disorders, neurological disorders, hypertension, psychotic disorders, neurological disorders, hypertension, psychotic disorders, neurological disorders (e.g. disease) and dyskinesias; The nucleic acids and polypeptides are also useful for treating viral infections caused by human immunodeficiency virus (HIV), and non-viral infections such as ocular disease (e.g. mineral professes (e.g. disease) and accular disease (e.g. disease). human proteases of the invention
